1.   A method for notifying a client of a change to data stored at a database, the method comprising:

receiving a subscription from the client, the subscription selecting a first subset of data from within a set of data;

generating a subscription plan for filtering the first subset from within the set of data;

receiving a query to be executed at the database, the query changing a second subset of data within the set of data;

generating a query plan for executing the query, the query plan for filtering the second subset from within the set of data;

matching the subscription to the query based on the set of data;

supplementing the query plan with the subscription plan;

prior to executing the supplemented query plan, evaluating the supplemented query plan whereby ~~the query changes the second subset of data and~~ the subscription filters the first subset of data from within the second subset of data to form a third subset of data;

determining based on the third set of data whether or not to generate a notification of the change to the third subset of data such that the notification is generated when the third subset of data is non-empty, and the notification is not generated when the third set of data is empty; and

~~if the third subset of data is non-empty, then generating a notification of the change to the third subset of data; and~~

~~if the third subset of data is empty, then not generating a notification of the change to the third subset of data~~

after evaluating the supplemented query plan, executing the query by changing the second subset of data.
